

Currently the most popular Robot Framework browser automation solution is Selenium and SeleniumLibrary. Together we want to change this. Selenium as a tool has been around since 2004. A lot of other browser automation solutions have come after that for example [Cypress](#), [Puppeteer](#) and now a recent addition [Playwright](#). New tools have shown to be faster and more reliable with additional capabilities. This means faster and more reliable test cases that can also test new things.

Me and Tatu Aalto have now done a technical concept level project that integrates Playwright with Robot Framework. The project is available at the Robot Framework community driven [MarketSquare](#) repository  
<https://github.com/MarketSquare/robotframework-browser>

To deliver a fully working solution for the Robot Framework community during autumn 2020, we would like to invite everyone to contribute to this effort.

Best regards,

Mikko Korpela - PSD to CSS converter

Tatu Aalto - Lead developer of SeleniumLibrary

Ismo Aro - behalf of Robot Framework Foundation

Antti Karjalainen - on behalf of Robocorp who is committed to participate in funding the project
